How to Attempt?

Unique Digits Count

Write a function to find the count of unique digits in a given number N. The number will be passed to the function as an input parameter of type int.

Assumption: The input number will be a positive integer number ≥ 1 and ≤ 25000 .

For e.g.

If the given number is 292, the function should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the function should return 3 because there are 3 unique digits in this number, '1', '0', and '5'.
